## **MILITARY AIRCRAFT LIFE JACKET:**

### **Purpose:**

Designed and manufactured by Magam Safety, for military pilots who may be ejected from high speed aircraft in an emergency. The assembly consists of a flotation section and a waist belt. The waist belt and attachment can be worn independently on dry land, increasing the user's comfort and safety while emergency landing on enemy's territory.

### **Description:**

The Life Preserver is compact, offering snag-free contours allowing comfort and freedom of movement. The flotation section closes with a quick release buckle, attached to the waist belt by a webbing harness and buckles. The section contains an inflatable stole and a blast proof survival vest. The stole container is fitted with two pockets: one on the left lobe for the oral valve and other one on the right lobe for battery and water light assembly. The inflatable stole is fitted to the container with loop webbing and line. Webbing attached to the bottom of each lobe maintains the correct angle. The life preserver collar, can also be integrated with the USAF PCU-15\P or USN MA-2 Torso harnesses. The survival vest section of the LPU-17\P can also be designed to carry a HEED-3 underwater escape oxygen module.

### **Technical Details:**

The inflatable stole is fitted with a Schrader valve. An oral-inflation valve and a tube on the left lobe. Press fasteners at the bottom of each lobe enable correct positioning and retention inside the stole container. The blast-proof pouch is made of synthetic fiber. It closes the stole container and the internal profile stole and is held shut by Velcro fasteners stitched along the closing edges. An opening handle is attached to the operating head lever. A CO<sub>2</sub> cylinder fits into the head retained by an internal fabric loop attached to the pouch's left side. Lifting becket loops are fitted to the blastproof pouch by press fasteners. A D-ring is attached to the pouch's right side, adjacent to the closure buttons. The waistband includes four equipment pockets, two on each side, made upon NATO and US Government specs, but are also available to any specific customer needs. Each pocket is fitted with a buckle for attaching the flotation section's harness webbing. The waistband closes at the front with a quick release buckle and at the back with an adjustment buckle. The pockets are design to carry government supplies equipment, such as: Radio Beacon, Strobe Light, Minifold Codes, Heliographs, Personal Weapon, Mandatory General & Medical survival kit.

- Cell buoyancy is greater then 38 Lbs.
- CO<sub>2</sub> cylinder 34\38 Grams.
- Lifting straps.
- Load bearing harness sustaining loads up to 2500 Lbs.
